“The easy way to communicate”

Over 20% of the population may experience communication difficulties in their lifetime. Communication issues might arise, in children or adults, from physical conditions, learning difficulties and speech disorders.

Some people grow out of these impediments, while others live with them throughout their entire lives. HelpTalk was designed to mitigate the distress caused by these communication difficulties.

HelpTalk is a mobile App which presents the user with a set of icons, that when tapped, cause the device to speak the respective action.

These actions are grouped together in a customizable profile.

On helptalk.mobi users can create profiles in multiple languages, suited to their daily routine, a specific disability, a specific event, educational purposes, or any other relevant scenario.

Users can choose to keep their profiles private or share them with others. Any public profile can be cloned and adjusted to meet each user's communication needs.

Since HelpTalk uses icons along with text, it can be used by children or the illiterate. Users can upload their own icons so that the profiles contain symbols they can relate to.

On the device users can load their private profiles and any of the public profiles for offline use. This way, they can easily change between profiles depending on the place and social setting.

If what the users want to express isn't contained in the currently loaded profile, they can write any sentence they want and HelpTalk will speak it.

HelpTalk remembers the most common sentences typed to provide easy access after writing just a few characters.

For users with reduced dexterity, HelpTalk presents two big Yes and No buttons to answer basic questions.

HelpTalk can also be used in emergency situations. When the user taps the S.O.S. button, a text message is sent to a pre-configured number, which can include his current location coordinates.

In cases where a user might suffer from any condition that may leave him disoriented, being able to be located by relatives is crucial.

When the phone receives a pre-configured message from a specific number, it replies with the user's current location.
